ABSTRACT: The total synthesis of optically active phenylbutenoid dimers 1, 3, and ent-3 is described. The key step to access optically active cyclohexene rings was achieved by Diels-Alder reaction of chiral acryloyloxazolinone 9 and phenylbeta-

everal phenylbutenoid dimers including 3-aryl-4-(E)-styrylcy-Clohexenes 1-6 and 1,2-bis((E)-styryl) cyclobutane were isolated from the rhizomes of a tropical Zingiber cassumunar, which has been used for the treatment of asthma, gastrointestinal distress, and motion sickness. All of the phenylbutenoid dimers were isolated as racemic mixtures, implying that they were produced by a nonenzymatic process. Structure elucidations of these compounds were based on analyses of their 1D and 2D NMR and mass spectroscopic data, and configurations of the groups attached to the cyclohexene ring of 1 and 3 were deduced to be cis and trans, respectively, on the basis of the ¹H NMR coupling constants. 1d

There has been a growing interest in phenylbutenoid dimers due to their diverse biological activities. For example, (\pm) -3-(3,4dimethoxyphenyl)-4-[(Z)-3,4-dimethoxystyryl]cyclohex-1-ene (1) has inhibitory activity for NO production induced by LPS in mouse macrophages.² Also, (\pm) -3-(3,4-dimethoxyphenyl)-4-[(E)-3,4-dimethoxystyryl]cyclohex-1-ene (3) has been reported to inhibit P-glycoprotein (P-gp) activity in a P-gp-overexpressing human breast cancer cell line,³ cyclooxygenase-2 (COX-2) activity, ^{1f,4} and cell proliferation in several human tumor cell lines.⁵ One limitation in biological evaluation of phenylbutenoid dimers is their low natural abundance. Thus, for precise analysis of structure—activity relationships, a new and general synthesis of optically active phenylbutenoid dimers became necessary. In an effort to further study the biological activities of these molecules, we were interested in the synthesis of optically active 3S-(3,4-dimethoxyphenyl)-4S-{(E)-3,4-dimethoxystyryl}cyclohex-1-ene (1), 3S-(3,4-dimethoxyphenyl)-4R- $\{(E)$ -3,4-dimethoxystyryl $\}$ cyclohex-1-ene (3), and 3R-(3,4-dimethoxyphenyl)-4S-{(E)-3,4-dimethoxystyryl}cyclohex-1-ene

Thermal [4 + 2] dimerization of 1-phenylbutadiene was reported to give cis- and trans-phenylbutenoid dimers in ratio of 1.4:1,° and dimerization of 1-(3,4-dimethoxyphenyl)butadiene (10) yielded the cis-isomer (1) in 23% yield as a racemic mixture. In our synthetic strategy, optically active phenylbutenoid dimers 1 and 3 would arise from (1R,2S)-2-(3,4-dimethoxyphenyl)

Scheme 1. Retrosynthetic Analysis

cyclohex-3-enecarbaldehyde (7), which in turn could be derived from the optically active compound (S)-4-benzyl-3-((1R,2S)-2-(3,4-dimethoxy phenyl)cyclohex-3-enecarbonyl)oxazolidin-2-one (8) via Diels-Alder cyclization between (S)-3-acryloyl-4benzyloxazolidin-2-one (9) and 1-(3,4-dimethoxyphenyl)butadiene (10) with high regio- and stereoselectivity (Scheme 1).8 The starting compound 9 was prepared from (S)-4-benzyloxazolidin-2-one by the reported method. Compound 10 was obtained from 3,4-dimethoxyaldehyde by modification of the previous method in 57% yield.1c Diethylaluminum chloride mediated asymmetric cycloaddition reaction of 9 and 10 afforded 8 as a single stereoisomer in quantitative yield. Reduction of 8 with lithium borohydride in THF afforded the corresponding compound ((1R,2S)-2-(3,4-dimethoxyphenyl)cyclohex-3-enyl)methanol (11), which was then oxidized to 7 by Swern oxidation. Compound 7 was converted to 3S-(3,4-dimethoxyphenyl)- $4S-\{(E)-3,4-\text{dimethoxystyryl}\}$ cyclohex-1-ene (1) by Horner— Wadsworth-Emmons condensation with dimethyl 3,4-dimethoxybenzylphosphonate (12) in 50% yield with high E/Zselectivity in a ratio of 95:5 (Scheme 2). 10' For the synthesis of trans-isomer 3, compound 7 was epimerized with K2CO3 in MeOH to thermodynamically more stable 13. However, when olefination of 13 was carried out under the same conditions, 3S- $(3,4-dimethoxyphenyl)-4R-\{(E)-3,4-dimethoxystyryl\}$ cyclohex-1-ene (3) was obtained in 24% yield.

Therefore, an alternative route involving stereoselective vinylstannylation from 13 and Stille coupling to improve the yield of 3 was attempted. Compound 13 was treated with PPh₃ and carbon tetrabromide to afford the dibromide, then converted to 4-((1S,6S)-6-ethynylcyclohex-2-enyl)-1,2-dimethoxybenzene (14) by Corey Fuch alkyne synthesis. Hydrostannylation of 14 with tributyltin hydride led to an 80% E and 20% E mixture of tributyl((E/E)-2-((1S,2S)-2-(3,4-dimethoxyphenyl)cyclohex-3-enyl)vinyl)stannane (15). The E/E mixture (15) was used directly without separation, as a single purification was planned for the final step of the synthesis. Stille coupling of 15 with 3,4-dimethoxyphenyl triflate (16) led to a 4:1 mixture of 3S-(3,4-dimethoxyphenyl)-4R-{(E)-3,4

dimethoxystyryl}cyclohex-1-ene (3) and 3S-(3,4-dimethoxyphenyl)-4R-{(Z)-3,4 dimethoxystyryl}cyclohex-1-ene (17) in 59% and 15% isolated yields, respectively, after separation by HPLC using a chiral OD-H column. 13 With the same synthetic route described above, $3R-(3,4-dimethoxyphenyl)-4S-\{(E)-$ 3,4-dimethoxystyryl}cyclohex-1-ene (ent-3) was prepared starting with (R)-3-acryloyl-4-benzyloxazolidin-2-one (ent-7) obtained by modification of the previous method.8 Optically active phenylbutenoid dimers 3, ent-3, and 17 were evaluated for their P-gylocoprotein inhibitory effect in a P-gp-overexpressing multidrug-resistant (MDR) human breast cancer cell line, MCF-7/ADR, using a previously reported protocol.³ Phenylbutenoids 3 and 17, with 3S, 4R configurations, were found to have more potent P-gp inhibitory activity compared to ent-3, with 3R, 4S configuration (Table 1). Further biological studies of these optically active phenylbutenoid dimers will be reported elsewhere.

In conclusion, phenylbutenoid dimer 1 and the structurally related congeners 3, 17, and ent-3 have been successfully synthesized from key intermediate 8 by employing asymmetric Diels—Alder reactions with Evans chiral oxazolidinone 9. The successful synthesis of phenylbutenoid dimers via a route that readily gives entry to analogues will allow for further investigations of their pharmacological properties and structure—activity relationships.

■ EXPERIMENTAL SECTION

General Experimental Procedures. All reagents were purchased from Aldrich Chemical Co. and Alfa Aesar Chemical Co. and used as obtained unless otherwise noted. RPMI 1640 cell culture medium and antibiotic-antimycotic agent were obtained from Invitrogen (Carlsbad, CA, USA), and fetal bovine serum (FBS) was from Hyclone (South Logan, UT, USA). Daunomycin, verapamil, and sulfo-rhodamine B (SRB) were supplied by Sigma-Aldrich (St. Louis, MO, USA). Anhydrous THF and CH₂Cl₂ were prepared by a solvent purification system. Melting points were obtained on a Thomas Scientific melting point apparatus and are uncorrected. Flash chromatography was carried out using silica gel

Scheme 2. Synthesis of Optically Active Phenybutenoid Dimers 1, 3, and ent-3^a

^a Reagents and conditions: (a) Et₂AlCl, CH₂Cl₂, −78 °C, 99%; (b) LiBH₄, H₂O, THF, 0 °C 78%; (c) DMSO, (ClCO)₂, Et₃N, CH₂Cl₂, −78 °C to rt, 94%; (d) **12**, n-BuLi, THF, −78 °C, 10 min, then 7, −78 °C to rt, 2 h, 50%; (e) K₂CO₃, MeOH, rt, 73%; (f) PPh₃, CBr₄, CH₂Cl₂, 0 °C, 99%; (g) n-BuLi, THF, −78 °C, 90%; (h) Bu₃SnH, AIBN, toluene, 80 °C, 83%; (i) Pd(PPh₃)₄, NMP, 90 °C, 74%.

Table 1. Effects of Phenylbutenoid Dimers on Daunomycin (DNM) Cytotoxicity a

| compound | $IC_{50} (\mu M)$ |
|--|-------------------|
| daunomycin | 14.33 ± 1.39 |
| verapamil | 1.90 ± 0.30 |
| $3S$ - $(3,4$ -dimethoxyphenyl)- $4R$ - $\{(E)$ - $3,$ | 1.44 ± 0.48 |
| 4-dimethoxystyryl}cyclohex-1-ene (3) | |
| $3S$ - $(3,4$ -dimethoxyphenyl)- $4R$ - $\{(Z)$ - $3,$ | 1.74 ± 0.33 |
| 4-dimethoxystyryl}cyclohex-1-ene (17) | |
| $3R$ - $(3,4$ -dimethoxyphenyl)- $4S$ - $\{(E)$ - $3,$ | 3.19 ± 1.08 |
| 4-dimethoxystyryl}cyclohex-1-ene (ent-3) | |

 $[^]a$ IC $_{50}$ values of DNM were determined in MCF-7/ADR cells after 2 h of incubation with three phenylbutenoids and verapamil at a final concentration of 50 μ M. Each data point is expressed as mean \pm SD from three different experiments. Daunomycin: negative control; verapamil: positive control.

60~(230-400~mesh) using various solvent mixtures. High-performance liquid chromatography (HPLC) was carried out on an Acme 9000 HPLC system (Younglin, Korea) equipped with a Chiragel OD-H column (250 mm \times 10 mm i.d., Daicel Chemical Industries, Tokyo, Japan). Optical rotation measurements were performed on a Rudolph Autopol IV (automatic polarimeter). NMR spectra were recorded at 300 or

400 MHz (1 H NMR) and 75 or 100 MHz (13 C NMR), referenced to an internal standard (TMS) or residual solvent protons, and signals are reported in ppm (δ). High-resolution mass spectra (HRMS) were recorded on an AEI MS3074 spectrometer and Agilent 6220 Accurate-Mass TOF LC/MS system. Circular dichroism measurements were performed using a Jasco J-715 CD/ORD spectropolarimeter.

(S)-4-Benzyl-3-[(1R,2S)-2-(3,4-dimethoxyphenyl)cyclohex-3enecarbonyl)]oxazolidin-2-one (8). To a solution of (S)-3-acryloyl-4benzyloxazolidin-2-one (9)9 (1.30 g, 5.62 mmol) in CH₂Cl₂ (50 mL) was added sequentially 1-(3,4-dimethoxyphenyl)butadiene (10) (1.50 g, 7.87 mmol) and diethylaluminum chloride (4.37 mL, 7.87 mmol) at -78 °C. The resulting solution was stirred for an additional 5 min at -78 °C and then poured into a stirred solution of 1 N HCl (40 mL). The organic layer was separated, and the aqueous layer was extracted with CH2Cl2 $(2 \times 50 \text{ mL})$. The combined organic layer was washed with H₂O (50 mL), dried over MgSO₄, and concentrated. The crude product was purified by crystallization from EtOAc and hexane to give 8 (2.37 g, 99%) as a white solid: mp 132 °C; $[\alpha]^{25}_{D}$ +307 (c 1.0, MeOH); ¹H NMR (300 MHz, CDCl₃) δ 7.31–7.23 (3H, m), 7.12–7.09 (2H, m), 6.78–6.75 (3H, m), 5.98-5.94 (1H, m,), 5.78-5.73 (1H, m), 4.55-4.47 (1H, m), 4.15-4.03 (4H, m), 3.86 (3H, s), 3.77 (3H, s), 2.98-2.92 (1H, m), 2.35-2.05 (4H, m), 1.81-1.75 (1H, m); 13 C NMR $(75 MHz, CDCl₃) <math>\delta$ 171.1, 150.8, 146.0, 145.7, 133.2, 130.8, 126.6, 126.4, 126.1, 124.7, 124.6, 119.1, 110.5, 108.2, 74.9, 74.5, 74.1, 53.4, 53.4, 53.0, 41.2, 39.0, 35.7, 21.5, 18.0; HREIMS m/z 421.1888 [M]⁺ (calcd for C₂₅H₂₇NO₅, 421.1889).

(1*R*,2*S*)-2-[(3,4-Dimethoxyphenyl)cyclohex-3-enyl)]methanol (11). To a suspension of LiBH₄ (535 mg, 24.6 mmol) in THF (28 mL) and H₂O (7 mL) was added 8 (3.45 g, 8.2 mmol) at -20 °C. The reaction mixture was stirred for 5 h at 0 °C, diluted with 0.1 N HCl (100 mL), and extracted with EtOAc (2 × 100 mL). The combined organic layer was washed with H₂O (100 mL × 2), dried over MgSO₄, and concentrated. The crude product was purified by flash column chromatography (EtOAc/hexane, 1:3–1:2) to give 11 (1.6 g, 78%) as a colorless oil: $\left[\alpha\right]^{25}_{D}$ +242 (*c* 1.0, MeOH); ¹H NMR (300 MHz, CDCl₃) δ 6.83–6.77 (3H, m), 5.94–5.90 (1H, m), 5.77–5.72 (1H, m), 3.86 (6H, s), 3.58 (1H, br s), 3.30–3.26 (2H, m), 2.20–2.15 (2H, m), 2.12–2.07 (1H, m), 1.60–1.41 (3H, m); ¹³C NMR (75 MHz, CDCl₃) δ 148.4, 147.6, 133.6, 129.1, 127.8, 121.6, 113.0, 110.7, 77.4, 77.0, 76.6, 65.1, 55.8, 42.1, 40.8, 24.7, 20.7; HREIMS m/z 248.1413 [M]⁺ (calcd for C₁₃H₂₀O₃, 248.1412).

(1R,2S)-2-(3,4-Dimethoxyphenyl)cyclohex-3-enecarbaldehyde (7). To a solution of dimethyl sulfoxide (1.3 mL, 18.3 mmol) in CH₂Cl₂ (20 mL) was added dropwise oxalyl chloride (1.6 mL, 18.3 mmol) at -78 °C. The reaction mixture was stirred for 1 h, and 11 (1.5 g, 6.1 mmol) in CH_2Cl_2 (10 mL) was added. After stirring for 1 h at the same temperature, triethylamine was added. The reaction mixture was allowed to warm to 0 °C, stirred for an additional 30 min, diluted with H₂O (50 mL), and extracted with CH_2Cl_2 (2 × 50 mL). The combined organic layer was washed with H₂O (100 mL), dried over MgSO₄, and concentrated. The residue was purified by flash column chromatography (EtOAc/hexane, 1:4) to give 8 (1.41 g, 94%) as a white solid: mp 74 °C; $[\alpha]^{25}_{D}$ +247 (c 1.0, MeOH); ¹H NMR (300 MHz, CDCl₃) δ 9.50 (1H, d, J = 2.1 Hz), 6.81 - 7.72 (3H, m), 6.00 - 5.97 (1H, m), 5.84 - 5.79(1H, m), 3.92 (1H, s), 3.85 (6H, s), 2.77-2.70 (1H, m), 2.33-2.09 (2H, m), 1.89–1.83 (2H, m); 13 C NMR (75 MHz, CDCl₃) δ 204.9, 148.7, 148.0, 132.5, 128.5, 128.0, 121.3, 122.5, 111.0, 55.8, 50.8, 41.1, 23.6, 18.8; HREIMS m/z 246.1255 [M]⁺ (calcd for C₁₅H₁₈O₃, 246.1256).

3S-(3,4-Dimethoxyphenyl)-4S-[(E)-3,4-dimethoxystyryl]cyclohex-1-ene (1). To a solution of dimethyl 3,4-dimethoxybenzylphosphonate (12)¹⁰ (137 mg, 0.53 mmol) in dry THF (3 mL) was added n-butyllithium (1.6 M in hexanes, 0.291 mL, 0.467 mmol) at -78 °C. The reaction mixture was allowed to warm to 0 °C and stirred for 20 min, and 7 (100 mg, 0.406 mmol) in THF (1 mL) was then added. The mixture was stirred for an additional 2 h, diluted with saturated NH₄Cl (20 mL), and extracted with EtOAc (20 mL). The organic layer was dried over MgSO₄ and concentrated. The residue was purified by flash column chromatography (EtOAc/hexane, 1:5) to give 1 (71 mg, 50%) as a white solid: mp 107 °C (lit. 1d mp 99–99.5 °C); $[\alpha]^{25}_D$ +103 (c 1.0, CHCl₃); ¹H NMR (300 MHz, CDCl₃) δ 6.82–6.69 (6H, m), 6.25 (1H, d, J = 15.7 Hz), 6.02 - 5.93 (1H, m), 5.84 - 5.76 (1H, m), 5.58(1H, dd, J = 15.7, 9.1 Hz), 3.86 (3H, s) 3.85 (3H, s), 3.83 (3H, s), 3.75(3H, s), 3.54–3.48 (1H, m), 2.96–2.64 (1H, m), 2.32–2.11 (2H, m), 1.72-1.57 (2H, m); 13 C NMR (75 MHz, CDCl₃) δ 149.1, 148.4, 148.2, 147.7, 133.9, 132.6, 131.2, 129.3, 128.6, 128.2, 122.0, 118.9, 113.7, 111.3, 110.5, 108.8, 56.0, 55.9, 55.9, 45.9, 42.7, 24.9, 24.4; HREIMS m/z380.1988 [M]⁺ (calcd for C₂₄₅H₂₈O₄, 380.1988).

(15,25)-2-(3,4-Dimethoxyphenyl)cyclohex-3-enecarbaldehyde (13). Potassium carbonate (493 mg, 3.57 mmol) was added to a solution of 7 (0.8 g, 3.24 mmol) in MeOH (15 mL), and the reaction mixture was stirred for 36 h at room temperature and then concentrated. The residue was diluted with H₂O (50 mL), extracted with EtOAc (50 mL), dried over MgSO₄, and concentrated. The residue was purified by flash column chromatography (EtOAc/hexane, 1:10) to give 13 (650 mg, 81%) as a colorless oil: $[\alpha]^{25}_{D}$ +168 (c 1.0, MeOH); ¹H NMR (300 MHz, CDCl₃) δ 9.69 (1H, d, J = 1.2 Hz), 6.82–6.74 (3H, m), 5.92–5.86 (1H, m), 5.70–5.65 (1H, m), 3.86 (6H, d, J = 3 Hz), 3.74–3.69 (1H, m), 2.61–2.55 (1H, m), 2.18–2.17 (2H, m), 1.98–1.93 (1H, m), 1.81–1.71 (1H, m), ¹³C NMR (75 MHz, CDCl₃) δ 204.0, 149.0, 147.8, 136.1, 129.1, 127.6, 120.2, 111.3, 111.2, 55.9, 55.8, 54.0, 41.0, 23.4, 21.0; HREIMS m/z 246.1255 [M]⁺ (calcd for C₁₅H₁₈O₃, 246.1256).

4-[(15,65)-6-Ethynylcyclohex-2-enyl]-1,2-dimethoxybenzene (14). Compound 14 was prepared from 13 in two steps (81%) by a reported method: ¹¹ white solid; mp 55 °C; $[\alpha]^{25}_D$ –187 (*c* 1.0, MeOH); ¹H NMR (300 MHz, CDCl₃) δ 6.79 (3H, d, J = 9.3 Hz), 5.91–5.87 (1H, m), 5.66–5.62 (1H, m), 3.87 (6H, d, J = 3 Hz), 3.40–3.36 (1H, m), 2.55–2.47 (1H, m), 2.20–2.18 (2H, m), 2.06–1.95 (2H, m), 1.82–1.70 (1H, m); ¹³C NMR (300 MHz, CDCl₃) δ 148.6, 147.7, 136.4, 128.9, 127.6, 120.2, 111.4, 110.7, 87.4, 77.4, 77.2, 77.0, 76.6, 69.3, 55.8, 47.1, 34.5, 27.3, 23.8; HREIMS m/z 242.1304 [M]⁺ (calcd for C₁₆H₁₈O₂, 242.1307).

Tributyl $\{(E)-2-[(1S,2S)-2-(3,4-dimethoxyphenyl)cyclohex-$ **3-enyl]vinyl**}stannane (15). 2,2′-Azobisisobutyronitrile (3 mg) was added to a solution of 14 (107 mg, 0.44 mmol) and tributyltin hydride (0.185 mL, 0.70 mmol) in toluene (3 mL). The mixture was heated to reflux for 6 h, diluted with EtOAc (10 mL), and washed with H₂O (10 mL). The organic layer was dried over MgSO₄ and concentrated. The residue was purified by flash column chromatography (EtOAc/ hexane, 1:10) to give 15 (197 mg, 83%) as an inseparable E/Z mixture (E/Z = 4:1): ¹H NMR (CDCl₃, 300 MHz) δ 6.77–6.62 (2.8H, m), 6.51-6.44 (0.2H m), 5.96-5.78 (2H, m), 5.74-5.59 (2H, m), 3.86 (2.4H, s), 3.85 (3H, s), 3.83 (0.6H, s), 3.20-3.1.7(0.2H, m, for Z-17), 3.15-3.09 (0.8H, m, for E-17), 2.28-2.14 (3H, m), 1.90-1.82 (1H, m), 1.68-1.61 (14H, m), 0.91-0.62 (14H, m); ¹³C NMR (75 MHz, $CDCl_3$) δ 152.3, 148.6, 147.2, 137.8, 130.5, 127.4, 126.3, 120.6, 111.3, 110.6, 55.8, 49.5, 47.4, 29.1, 27.3, 24.6, 13.7, 9.3; HREIMS m/z 478.1891 $[M - C_4H_8 + 1]^+$ (calcd for $C_{24}H_{38}O_2Sn$, 478.1894).

3S-(3,4-Dimethoxyphenyl)-4R-[(E)-3,4-dimethoxystyryl]-cyclohex-1-ene (3) and 17. To a solution of 15 (780 mg, 1.45 mmol), 16^{13} (504 mg, 1.75 mmol), and LiCl (74 mg, 1.75 mmol) in N-methylpyrrolidone (5 mL) was added Pd(PPh₃)₄ (340 mg, 0.31 mmol). The reaction mixture was heated for 3 h, diluted with H₂O (30 mL), and extracted with EtOAc (30 mL). The organic layer was washed with H₂O (2 \times 20 mL), dried over MgSO₄, and concentrated. The residue was purified by flash column chromatography (EtOAc/hexane, 1:5) to give a mixture of 3 and 17 (430 mg, 74%). The mixture of 3 and 17 (430 mg) was subjected to semipreparative HPLC, using an isocratic mixture of hexane/2-propanol (9:1, 1.5 mL/min) as solvent system, to afford 17 (16 mg) and 3 (226 mg).

Biological Assays. Biological assays were conducted according to published protocols. In brief, MCF-7/ADR cells were cultured in RPMI 1640 supplemented with 10% FBS, 2 mM L-glutamine, 10 mM HEPES, 24 mM NaHCO₃, and 1% antibiotic—antimycotic agent and maintained at 37 °C in a humidified 5% CO₂ atmosphere. In order to examine the effects of phenylbutenoid dimers on daunomycin cytotoxicity, the cells (5000 cells/well) were seeded in 96-well plates and incubated for 24 h at 37 °C. Then, daunomycin was added to each well to achieve final concentrations of 1.0×10^{-7} to 1.0×10^{-4} M with and without 50 μ M phenylbutenoid dimers 3, ent-3, and 17, followed by incubation for 2 h. Daunomycin containing 50 μ M verapamil was used as the positive control. After the cells were washed and maintained with 200 μ L of fresh media for 72 h, the cytotoxicity of daunomycin was determined using a modification of a SRB staining assay. 14
